

## Case Workshop on Environmental Protection Technology

The FY2013 Case Workshop on Environmental Protection Technology was held.

The goal of this class was for students to learn specialized knowledge related to environmental conservation, using actual issues related to the marine environment field as case studies, and to acquire skills for forming opinions and synthesizing the results of debates via group discussions.

This class was held as five intensive lectures from December 2013 to January 2014.

During the first half of the class, the teacher of the week gave lectures on environmental issues. During the second half, group discussions were held in which each group discussed policies and other measures to resolve issues related to the lecture content. Finally, each group presented the results of its discussions.

The students in each group exchanged opinions in a lively way, and some of the groups even wanted more time for their discussions.
